

Abstract of the Disclosure

A method for apparatus for masking a postamble ringing phenomenon in a DDR SDRAM comprising the steps of storing data, which are applied from a memory controller, in a data 5 input latch through a data buffer and aligning the stored data, controlling the data input latch in such a manner that the data stored in the data input latch do not change, transmitting the data stored in the data input latch to a data input/output detection amplifier, enabling the data 10 input latch to receive new data after the data, which have been transmitted to the data input/output detection amplifier, are transmitted to a global input/output line. In the method, a stable write operation can be performed even in devices having high operation speeds, such data rates above 15 400MHz. Thus, a stable write operation can be performed under conditions wherein the tDQSS has a value of 0.75tCK to 1.25tCK.
